

DW_fp_square

Floating-Point Square

Version, STAR and Download Information: [IP Directory](#)

Features and Benefits

- The precision format is parameterizable for either IEEE single, double precision, or a user-defined custom format
- Hardware for denormal numbers of IEEE 754 standard is selectively provided.
- Fully compatible with the IEEE 754 Floating-point standard¹ with proper set of parameters
- DesignWare datapath generator is employed for better timing and area

Description

DW_fp_square is a floating-point square logic that squares one floating-point operand: a by a to produce a floating-point product, z .

The input `rnd` defines a 3-bit rounding mode value (see [Rounding Modes](#) in the *Datapath Floating-Point Overview*) and the output `status` is an 8-bit optional status flags.

Table 1-1 Pin Description

Pin Name	Width	Direction	Function
<code>a</code>	$exp_width + sig_width + 1$ bits	Input	Input data
<code>rnd</code>	3 bits	Input	Rounding mode
<code>z</code>	$exp_width + sig_width + 1$ bits	Output	Square of a (a^2)
<code>status</code>	8 bits	Output	See STATUS Flags in the <i>Datapath Floating-Point Overview</i>

Table 1-2 Parameter Description

Parameter	Values	Description
<code>sig_width</code>	2 to 253 bits Default: 23	Word length of fraction field of floating-point numbers a and z
<code>exp_width</code>	3 to 31 bits Default: 8	Word length of biased exponent of floating-point numbers a and z

1. For more information, see [IEEE 754 Compatibility](#) in the *Datapath Floating-Point Overview*.

Table 1-2 Parameter Description (Continued)

Parameter	Values	Description
ieee_compliance	0 or 1 Default: 0	When 1, the generated architecture is fully compliant with IEEE 754 standard, including the use of denormals and NaNs.

Table 1-3 Synthesis Implementations

Implementation Name	Function	License Feature Required
rtl	Synthesis model	DesignWare

Table 1-4 Simulation Models

Model	Function
DW02.DW_FP_SQUARE_CFG_SIM	Design unit name for VHDL simulation
dw/dw02/src/DW_fp_square_sim.vhd	VHDL simulation model source code
dw/sim_ver/DW_fp_square.v	Verilog simulation model source code

DW_fp_square provides the hardware for denormal numbers and NaNs of IEEE 754 standard. If the parameter `ieee_compliance` is turned off, denormal numbers are considered as zeros, and NaNs are considered as Infinity. Otherwise, denormal numbers and NaNs become effective and additional hardware for the square of denormal numbers is integrated.

For more information about the floating-point system defined for all the DW_fp components, including status flag bits, and integer and floating-point formats, refer to the [Datapath Floating-Point Overview](#).
